

Revolutionising Life Since 1982™

Five named product rails, one founder brand,
and a practical Azure credit case for July and
August launches.

Founder Above the Fold | FlatFinder | No More
Hieroglyphics | Thrifty | Rube.works

July 2026

One founder brand ties the launch bench together

The story is not four disconnected experiments. It is one operating system for turning messy real-life workflows into usable AI-native products.

Goal -> shared system -> visible launches -> credit-worthy growth workload

The named product rails are ready to label

Each part has a launch slot and a practical job. Unknowns stay labelled until customer tests confirm them.

A Founder Above the Fold
LinkedIn profile MCP app and app

B FlatFinder Housing Revolutionized
Housing-search workflow, launching
July 2026

C No More Hieroglyphics
Legal gibberish to English translator

D Thrifty
"I may be thrifty, but I'm not frugal."
Launching July 2026

E Mega Awesome Agent Creator
Rube.works, a digital Rube Goldberg
machine
Launching August 2026

F Additional launches
Coming soon, with space left on the rail

Founder Above the Fold makes LinkedIn presence controllable

This is the most defined product today: a safe single-owner LinkedIn operating workbench that keeps posting, profile copy, voice, and analytics aligned.

Place

Queue and schedule posts

Draft posts move into a visible queue, then publish through permitted LinkedIn APIs when the owner has connected the app.

Lock

Voice gate before launch

British English and Prototype Cafe voice rules check copy before it can be queued.

Inspect

Profile drift stays manual

Headline, About, and Experience copy are tracked as canonical panels, with a clear manual paste flag.

NO SCRAPING

NO AUTO-DMS

NO PROFILE EDITS

OWNER-ONLY V1

FlatFinder turns the housing hunt into an inspection loop

Working thesis: housing search gets less chaotic when every option can be captured, compared, checked, and followed up from one repeatable rail.

1

Capture

Place listings, requirements, viewings, and notes into one housing workbench.

2

Compare

Align affordability, commute, availability, and fit so choices are not trapped in scattered tabs.

3

Test

Turn the July launch into proof: can a user make a better shortlist faster?

Evidence label

Known now

Name and July 2026 launch timing are provided. Product mechanics should be validated through the first search workflow test.

No More Hieroglyphics translates legal fog into English

This is the anti-gatekeeping rail: leases, contracts, terms, privacy policies, and other dense documents become readable enough to inspect before signing.

Insert

Documents in

PDFs, images, or pasted text can be placed into the tool for review.

Inspect

Traps out

Buried obligations, fee escalations, auto-renewals, arbitration, and ambiguity get flagged.

Label

English, not legalese

The product shows what the document says and what it means without gatekeeping.

NOT ATTORNEYS

NOT LEGAL ADVICE

PART OF FLATFINDER

Thrifty makes careful spending feel sharp, not small

The brand starts with a memorable line and a July launch slot. The product should make cost-conscious decisions feel designed, not apologetic.

'I may be thrifty, but I'm not frugal.'

Working job

Separate value from cheapness

Thrifty can own the space between saving money and lowering standards.

First test

Can people repeat the line?

The tagline is already sticky. The launch test is whether users understand the product promise underneath it.

Launch rail

July 2026

Keep the first release narrow enough to ship, measure, and revise quickly.

Rube.works turns agent creation into a visible machine

Mega Awesome Agent Creator is the playful power tool: a digital Rube Goldberg machine for assembling agent workflows without hiding the mechanism.

One Azure backbone can power the whole bench

The products can share the same cloud pattern: web apps, databases, queues, storage, AI calls, monitoring, and cost controls.

The credit request is a runway and workload request

Microsoft should see the ask as practical: reduce launch friction, fund real AI/data experiments, and keep cost controls visible while the portfolio proves demand.

Why now

Multiple launches share one month

July and August create real hosting, testing, data, and AI demand instead of a vague future infrastructure wish.

What credits unlock

More tests before cash burn

Credits buy room for staging, telemetry, AI-assisted workflows, privacy checks, and realistic launch traffic.

Evidence guardrail

Exact tier must be verified

Microsoft public pages describe credits up to \$150,000; review and referral paths affect the tier.

Ask for the highest eligible Azure credit path, not a promised amount.

Launch discipline lowers programme risk

The portfolio is strongest when it shows controlled build habits: privacy, consent, budget alerts, official APIs, and clear setup states.

1

Privacy and cookies

Live public routes, consent setup, and plain setup states before production traffic.

2

Official API rails

Founder Above the Fold avoids scraping, unsafe LinkedIn automation, and hidden profile-edit claims.

3

Build checks

Lint, typecheck, build, link checks, browser checks, and manual panels travel with each surface.

Manual rule

Every product ships with the manual beside it

The same pass that builds a feature must also produce the assembly panel, warning labels, and finished-build test.

July and August are the first proof rails

The next evidence is not more description. It is working links, measured usage, and a clean Azure setup that can scale without surprise bills.

July 2026

Launch the July rails

Founder Above the Fold, FlatFinder, Thrifty, and the FlatFinder-linked NMH surface move into public or beta-ready use.

August 2026

Launch Rube.works

Mega Awesome Agent Creator becomes the visible machine for assembling and testing agent workflows.

Coming soon

Leave the spare rail open

Additional launches can be added without derailing the deck or pretending all details are known today.

Disproving test: if users cannot complete the first workflow without live coaching, fix the product or the manual before scaling spend.

Fit the Azure credit rail to the launch bench

Revolutionising Life Since 1982™ is ready to turn a crowded invention bench into measured software launches. The immediate need is credit support sized to the real workload.

Review the portfolio for the highest eligible Azure startup-credit path and pair it with architecture guidance, cost controls, and launch support.

Approve

Azure credits

Fund prototypes, staging, launch traffic, and AI/data tests.

Align

Architecture

Pick the first Azure services and clamp down cost alerts.

Open

Partner path

Check Microsoft startup, investor, Marketplace, or co-sell routes.
